

**CSS:**

CSS is used for all pages for styling.

**Javascript:**

JavaScript is used to create tables and inputs in the shop.php page

**JQuery:**

JQuery is used in the home page to show fade in effect for the photos, menu, logo. Top information bar also has some JQuery effect such as appending new contents when mouse enter and leave the area.

**PHP:** PHP is used to get data from shop.php and post data on the order.php pages. Also, I used php to create a txt file and save ordering data in the txt file.
